

### Output

Hostname: prod-repl-java-6f59d9477d-sfmsg  
IP Address: 10.236.27.4

=== Code Execution Successful ===

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac RemoteIP.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java RemoteIP  
Remote Host: google.com  
IP Address: 142.250.192.238
```

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac CanonicalName.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java CanonicalName  
Given Address: 8.8.8.8  
Canonical Hostname: dns.google
```

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac IPVersions.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java IPVersions  
IP addresses for: google.com  
IPv4: 142.250.192.238  
IPv6: 2404:6800:4002:81c:0:0:0:200e  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>
```

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac CheckIPVersion.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java CheckIPVersion  
Input Address: 2001:4860:4860:0:0:0:0:8888  
The address is IPv6  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>
```

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac IPCharacteristics.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java IPCharacteristics  
IP Address: 192.168.1.10  
Is Loopback Address? false  
Is Link-Local Address? false  
Is Site-Local Address? true  
Is Multicast Address? false  
Is Any-Local Address? false  
Is Multicast Global? false  
Is Multicast Link Local? false  
Is Multicast Site Local? false
```

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java CompareDomains
Error: java.net.UnknownHostException: No such host is known (helios.ibiblio.org)

C:\Users\user\Desktop\pncw\BCA\6th sem\java>
```

## Conclusion

## Observation

```
Interface: lo

## Conclusion

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java CheckReachability
Pinging: www.google.com
Host is reachable.
```

---

## **Conclusion**

The program successfully demonstrated how to check if a remote host is reachable using Java's `isReachable()` method. This is useful for basic network diagnostics and testing connectivity between systems.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java SpamCheck
Enter a message:
Click here to win free macbook.
This message is SPAM.
```

## Conclusion

The program successfully demonstrated a basic spam detection mechanism using keyword matching. It shows how simple text analysis can be used to identify suspicious or unwanted messages.

## Observation

```
Processing Web Server Log File:
IP Address: 192.168.1.5
Method: GET
Resource: /index.html
Status Code: 200
-----
IP Address: 192.168.1.6
Method: POST
Resource: /login
Status Code: 302
-----
IP Address: 192.168.1.7
Method: GET
Resource: /about.html
Status Code: 200
-----
```

## Conclusion

Java's file-handling features make it easy to process server log files. The program demonstrated how to read log entries, split them into components, and analyze useful information for monitoring server performance.

## Observation

```
Full URL: https://www.example.com:8080/path/to/resource?query=test
Protocol: https
Host: www.example.com
Port: 8080
Path: /path/to/resource
Query: query=test
File: /path/to/resource?query=test
```

## Conclusion

By using the URL class and its getter methods, we can easily extract individual parts of a URL. This demonstrates how Java provides built-in functionality for URL parsing without manually splitting strings.

```
C:\Users\user\Desktop\pncw\BCA\6th  
http protocol is SUPPORTED.  
https protocol is SUPPORTED.  
ftp protocol is SUPPORTED.  
file protocol is SUPPORTED.  
mailto protocol is SUPPORTED.  
jar protocol is NOT supported.
```

## Conclusion

By using the URL class and handling MalformedURLException, we can check which protocols the virtual machine supports. This method provides a simple way to test network protocol handling in Java.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac DownloadWebPage.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java DownloadWebPage  
Web page downloaded successfully!
```

## Conclusion

Using Java's URL and URLConnection classes, we can download a web page's content and save it locally. This demonstrates basic web scraping and network programming in Java.

```
Base URI: https://www.example.com/folder/  
Relative URI: page.html  
Resolved URI: https://www.example.com/folder/page.html
```

## Conclusion

The program demonstrates how Java's URI class can resolve relative URIs to absolute URIs using the `resolve()` method, which is helpful in web development and resource management.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac DownloadObject.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java DownloadObject  
File downloaded successfully!
```

## Conclusion

By using Java's URL and openStream() methods along with FileOutputStream, we can download objects or files from the internet efficiently. This demonstrates basic file handling and network programming in Java.

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java XwwwFormEncoded
x-www-form-urlencoded string:
name=Deep&email=deep.drsn%40example.com&message=Hello%2C+how+are+you%3F
```

## Conclusion

The program demonstrates how Java's URLEncoder class converts strings into x-www-form-urlencoded format. This is essential for sending safe and properly encoded form data over HTTP.

## Observation

```
Server response:
{
  "args": {
    "age": "20",
    "name": "Deep"
  },
  "headers": {
    "Accept": "text/html, image/gif, image/jpeg, *; q=.2, */*; q=.2",
    "Host": "httpbin.org",
    "User-Agent": "Java/17.0.10",
    "X-Amzn-Trace-Id": "Root=1-6938089e-298a94b54e23f80f028bc6fd"
  },
  "origin": "27.34.73.100",
  "url": "https://httpbin.org/get?name=Deep&age=20"
}
```

## Conclusion

By using Java's URL and HttpURLConnection classes, we can communicate with server-side programs using HTTP GET. This is useful for fetching data or interacting with web services.

|     |  |  |  |
|-----|--|--|--|
| 31. |  |  |  |
| 32. |  |  |  |
| 33. |  |  |  |
| 34. |  |  |  |
| 35. |  |  |  |

## Observation

When the program is executed, it connects to the given URL, reads all the HTML content, and stores it in a file named downloaded\_page.html.

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac WebPageDownload.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java WebPageDownload  
Web page downloaded successfully!
```

## Conclusion

The program successfully demonstrates how to use URLConnection to access a webpage and download its content. This shows how Java can be used for network programming tasks such as retrieving data from the internet.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java ReadHTTPHeaders
HTTP Header Fields:

Date: Thu, 26 Mar 2026 03:09:55 GMT
Content-Type: text/html
Transfer-Encoding: chunked
Connection: keep-alive
Server: cloudflare
Last-Modified: Tue, 24 Mar 2026 22:07:32 GMT
Allow: GET, HEAD
Accept-Ranges: bytes
Age: 359
cf-cache-status: HIT
CF-RAY: 9e22f593cd5a98d6-KTM
```

## Conclusion

The program successfully retrieves and prints all HTTP header fields from a webpage using `HttpURLConnection`. This demonstrates how Java can interact with HTTP protocol metadata in network programming.

## Observation

```
Date: Thu, 26 Mar 2026 03:27:39 GMT
Content-Type: text/html
Transfer-Encoding: chunked
Connection: keep-alive
Server: cloudflare
last-modified: Tue, 24 Mar 2026 22:07:32 GMT
allow: GET, HEAD
Accept-Ranges: bytes
Age: 1423
cf-cache-status: HIT
CF-RAY: 9e230f907eb99e80-KTM
```

## Conclusion

The program successfully prints all HTTP header fields using `HttpURLConnection`. This demonstrates how Java applications can read and process HTTP protocol metadata, which is essential in network programming.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java HttpRequestMethod  
HTTP Request Method Used: GET
```

## Conclusion

The program successfully retrieves and displays the HTTP request method using `URLConnection`. This demonstrates how Java handles HTTP communication and how request types are identified in network programming.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java PrintURL  
The URL is: https://example.com/path/page
```

## Conclusion

The program successfully demonstrates how to create a URL object and print it in Java. This shows the basic usage of the URL class in network programming.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java SourceViewer
Response Code: 200
Response Message: OK

--- Web Page Source ---

<!doctype html><html lang="en"><head><title>Example Domain</title><meta nam
e="viewport" content="width=device-width, initial-scale=1"><style>body{back
ground:#eee;width:60vw;margin:15vh auto;font-family:system-ui,sans-serif}h1
{font-size:1.5em}div{opacity:0.8}a:link,a:visited{color:#348}</style></head
><body><div><h1>Example Domain</h1><p>This domain is for use in documentati
on examples without needing permission. Avoid use in operations.</p><p><a h
ref="https://iana.org/domains/example">Learn more</a></p></div></body></htm
l>
```

## Conclusion

The program successfully acts as a source viewer that retrieves and displays both the HTTP response details and the full webpage source. This demonstrates how Java handles server communication, response checking, and reading webpage content.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>javac LastModifiedTime.java  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java LastModifiedTime  
Last Modified: Wed Mar 25 03:51:31 NPT 2026
```

## Conclusion

The program successfully retrieves the Last-Modified timestamp of a URL using Java's `URLConnection`. This helps understand how web servers share metadata about resource updates in network programming.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java GetAllHeaders
All Header Fields and Values:

Accept-Ranges : [bytes]
Allow : [GET, HEAD]
Transfer-Encoding : [chunked]
HTTP/1.1 200 OK
Last-Modified : [Tue, 24 Mar 2026 22:06:31 GMT]
CF-RAY : [9e33a326cd334f3c-KTM]
Server : [cloudflare]
Connection : [keep-alive]
Cache-Control : [HIT]
Age : [2431]
Date : [Sat, 28 Mar 2026 03:44:36 GMT]
Content-Type : [text/html]
```

## Conclusion

The program successfully retrieves and displays all HTTP header fields and their values using Java's `URLConnection`. This demonstrates how clients can access important metadata sent by web servers.

## Observation

```
--- Server Response ---  
  
HTTP/1.1 200 OK  
Date: Sat, 28 Mar 2026 04:16:55 GMT  
Content-Type: text/html  
Transfer-Encoding: chunked  
Connection: close  
Server: cloudflare  
Last-Modified: Tue, 24 Mar 2026 22:06:31 GMT  
Allow: GET, HEAD  
Accept-Ranges: bytes  
Age: 5271  
cf-cache-status: HIT  
CF-RAY: 9e33d277ca037674-KTM  
  
210  
<!doctype html><html lang="en"><head><title>Example Domain</t  
itle><meta name="viewport" content="width=device-width, initi  
al-scale=1"><style>body{background:#eee;width:60vw;margin:15v  
h auto;font-family:system-ui,sans-serif}h1{font-size:1.5em}di  
v{opacity:0.8}a:link,a:visited{color:#348}</style></head><bod  
y><div><h1>Example Domain</h1><p>This domain is for use in do  
cumentation examples without needing permission. Avoid use in  
operations.</p><p><a href="https://iana.org/domains/example"  
>Learn more</a></p></div></body></html>  
  
0
```

## Conclusion

The program successfully reads data from a server using Java's Socket class. It demonstrates low-level network communication, showing how a client can manually send requests and receive responses directly from a server.

## Observation

### Server

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>
Server started...
Client connected!
Data sent to client.

C:\Users\user\Desktop\pncw\BCA\6th sem\java>
```

### Client

```
Connected to Server!
--- Message from Server ---
Hello from the Server!
```

## Conclusion

This program demonstrates how a server can write/send data to a client using Java Socket programming. The server uses `ServerSocket` to listen for connections and `PrintWriter` to send messages. This lab shows the basics of client-server communication in networking.

## Observation

### Client

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java Client
Time sent to server: 13:10:30.999372600

C:\Users\user\Desktop\pncw\BCA\6th sem\java>
```

### Server

```
server is running...
client connected.
time received from client: 13:10:30.999372600
```

## Conclusion

The program successfully demonstrates socket communication in Java. The client is able to send its current time to the server, and the server reads and displays it. This exercise helps understand network programming basics, client-server communication, and the use of Input/Output streams with sockets.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th  
Scanning ports on host: localhost  
Port 135 is OPEN  
Port 445 is OPEN  
Port 554 is OPEN  
Port scanning completed.
```

## Conclusion

The program successfully scans low-numbered ports using Java sockets. It demonstrates how to, create socket connections, detect open ports, and practical use of socket exceptions. This experiment helps understand basic security concepts and how servers expose services on specific ports.

## Observation

```
=== Socket Information ===  
Local Address      : /192.168.1.107  
Local Port        : 53071  
Remote Address     : example.com/104.18.26.120  
Remote Hostname    : example.com  
Remote Port       : 80  
Is Connected?     : true  
Is Closed?        : false
```

## Conclusion

The program successfully retrieves and displays detailed socket information. This lab helps in understanding how sockets connect between two endpoints, how to extract socket metadata, the concept of local versus remote ports, and how to check the connection status.

## Observation

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java sServer  
Server started... waiting for client.  
Client connected from: /127.0.0.1
```

## Conclusion

The program successfully demonstrates how to create a simple server socket in Java. It shows how to open a listening port, how to accept client connections, and how the server terminates after establishing a connection.

```
}  
  
} catch (Exception e) {  
    e.printStackTrace();  
}  
}
```

## Observation

### Server

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java DateTimeServer  
DateTime Server started...  
Client connected: /127.0.0.1
```

### Client

```
C:\Users\user\Desktop\pncw\BCA\6th sem\java>java DateTimeClient  
From Server: Current Date & Time: 2026-03-29T09:18:52.428120200  
C:\Users\user\Desktop\pncw\BCA\6th sem\java>
```

## Conclusion

The program successfully demonstrates how to use multi-threading with sockets to create a server that can serve multiple clients at the same time. Each client receives the current system date and time independently.
