

10	To create a user-defined namespace and define a Student class inside it including a constructor to initialize fields		
11	To add a destructor to the Student class that outputs a message when an instance is garbage-collected		
12	To Create a Book class using private fields and public properties, and resolve naming conflicts in the constructor with the this keyword		
13	To Implement a Rectangle class that overloads constructors to allow various ways to initialize length and width		
14	To Create a Complex Number class and overload the + operator to add two complex numbers		
15	To demonstrate inheritance by creating a Vehicle base class and a Car subclass that overrides a method		
16	To Define an abstract base class Shape containing an abstract method CalculateArea(), then implement concrete subclasses Circle and Square that provide their own area calculations		
17	To Modify the Car class so that it uses the base keyword to invoke the StartEngine() method from its parent Vehicle class before executing its own override logic		
18	To Demonstrate the ability of the object type to hold values of various data types, and use GetType() to display each value's actual runtime type.		
19	To define a struct named Point containing x and y coordinates, using public, private, and internal access modifiers to illustrate encapsulation levels.		
20	To Develop a C# console application to manage a BCA Student database
